

System3 Sanitizer

System 3's patented non-leaching technologies work in systematic unison with one another. Once a surface or material is treated with System 3, System 3 forms a covalent bond with the substrate and creates a microbiostatic protective shield. This shield creates a bed of impenetrable spikes, each of which carry a positive charge that attracts the negatively charged particles. Once attracted, the protective layer of spikes provides continued protection to disrupt unwanted surface particles.

- System 3 can be sprayed on virtually any surface from food prep stations to garments.
- System 3 can be sprayed and wiped or left to dry, wiped on, used with an electrostatic sprayer, and fogged.
- System 3 is scientifically designed to comply with CDC and WHO requirements. System 3 only uses EPA-approved technologies!
- 1 gallon bottle
